

MANUAL

Nano4U Protection thanks you for choosing our products.

To fully use the potential of our premium protection spray, please follow the instructions in this manual.

How Nano4U Protection functions. Under a microscope, most surfaces look very rough and remind of mountain ranges. Dirt and bacteria normally cling to these surfaces. Conventional detergents that often do harm to the environment do not remove dirt totally or are used on top of the dirt, only imitating cleanliness. Nano4U Protection fills these "mountains" with clean nanoparticles of silica sand which are 500 times finer than a human hair.

The surface becomes superhydrophobic and repels all sorts of substances.

Surprisingly, this barrier is breathable, flexible and very strong. The coating is eco-friendly, since it is made of silica sand. Besides, it can be cleaned with water, that is the consumption of toxic substances is lower.

Your spending on cleaning is also reduced! Our spray is good for upholstery, mattresses, suits, car seats, ties, outdoor clothes, workwear, sneakers and other sports shoes, suede shoes, non-polished leather, purses, etc.

How to apply:

For a prolonged effect, all surfaces must be absolutely clean, dry and free from any other coatings, such as conditioners and silicones. The coating will not be efficient or will not form a protection barrier, if there is still some polish or a similar coating on the treated surface. Spray Nano4U Protection onto the surface from a distance of about 10-15 cm. Make sure that the treated material is evenly and thoroughly moistened. Use a brush or your hand to rub the spray all over the surface. Repeat the procedure in 5-10 minutes. 2-3 sprayings are necessary, with the wet-on-wet effect. As a rule, it is enough for fabrics and shoe surfaces of medium thickness. Thicker fabrics need more sprayings. If there is too much spray on the surface, rub it off with a gloved hand. The surface is ready to use in 24 hours. After that, thermal treatment is recommended (with a home hair dryer).

Peculiarities of the product: easy cleaning from dirt, water-resistant, eco-friendly, breathable, flexible, exceptionally strong.

Made in Germany. Antibacterial/ superhydrophobic nanocoating, resistant to temperatures from -150 °C to +450 °C.

Warning! The above properties disappear as a result of strong mechanical impacts or washing with chemical substances!

Quality verified by leading German research and development institutions.

Nano4u team is happy to welcome you on our official website.

A little bit about us

In 2013, a group of private Russian investors decided to put their money into a German R&D company working on protection nanocoatings. The following top-priority goal was set – to create the world's best single-component coating for protection of shoes and clothes.

The whole year 2014 was devoted to research, tests, search for the optimum nanoparticles dimensions and study of their interactions with various materials. That was how our first product was created – Fabric, the most efficient single-component protection spray for porous materials. However, the problem with leather still remained, since Fabric was not good for leather and could leave spots on it. Leather is difficult in treatment because there are various oils, grease and other sorts of dirt on it. Hence, our second product was developed – a spray for leather. It slightly penetrates the leather and makes good contact with the surface. Today, this composition is the most efficient one for leather protecting it from UV rays, cracking and accidental spills of various liquids. At the moment, we have several promising research projects, in various stages of completion. In September 2016, we will be happy to present to you two new unique products.

In 2015, we created a trademark Nano4u Protection and started to sell our products in Russia. The trademark is solely for Russia and has no connections to any other countries. Unfortunately, the name Nano4U proved to be vulnerable for plagiarism, so you could now find innumerable variations close to our trademark. That is why you should be very careful: be aware that you can only buy the original Nano4U

products on our official websites – www.nano4u.ru for Russia and www.drygoose.com for Europe, the USA and other countries. The sales will start in September 2016. Our products can not be bought anywhere else!

In 2016, we decided to create a new trademark and move our production to Finland. Now all our products are manufactured in Finland under the trademark Dry Goose OY Ltd, 00970 Helsinki Finland (EU).

If you own a clothing shop or a shoe shop, and you are interested in working with the top producers and getting high-quality goods, then Nano4U team is ready to make you a customized offer.

We can officially supply our goods to Russia, Europe, the USA and other countries. Our team speak the following languages: Russian, English, Finnish, German and French, so you can ask your questions in any of these languages. All official retailers will be presented on our websites, irrespective of their locations.

Thank you for your time.
